# Shailesh Lokhande

E-mail: - shaileshlokhande860@gmail.com , Phone: - +917030890113

## *Profile Summary*

Assistant System Engineer at TCS with hands-on experience in developing AI-powered chatbot solutions integrated with REST APIs. Currently working on applying NLP techniques along with Machine Learning and Deep Learning concepts to improve conversational accuracy and system performance. Passionate about building intelligent, scalable applications and continuously learning emerging AI technologies.

## *Key Skills*

**Technical Skills:**

- **Languages:** Python, Java, ML, DL, NLP
- **Front-end:** Angular, HTML5, CSS3, Bootstrap
- **Back-end:** Fast API, Servlet, Spring Boot
- **Databases:** MySQL, Oracle, SQLite
- **Version Control:** Git, GitHub
- **Tools/DevOps:** Docker, AWS
- **Other:** REST APIs, Langchain, LangGraph

**Soft Skills:**

- Problem-Solving
- Communication
- Teamwork and Collaboration
- Time Management
- Adaptability
- Agile Development

## *Educational Details*

**2020-2024** **B. Tech in Computer Science and Engineering**
Tatyasaheb Kore Institute of Engineering and Technology, Warananagar.
CGPA: - 8.83

**2018-2020** **HSC**
Vivekanand College Kolhapur.
Percentage: - 79%

## *Professional Experience*

**Tata Consultancy Services (TCS)**
*Assistant System Engineer*
*Project: AI-Powered Chatbot (Apr 25 - Ongoing)*

- Currently working on the development of an AI-based chatbot by integrating REST APIs for real-time data retrieval and response generation.
- Applying concepts of **Natural Language Processing (NLP)** to improve intent recognition and response accuracy.
- Utilizing **Machine Learning and Deep Learning fundamentals** to understand chatbot behavior and model performance.
- Collaborating with team members to design, test, and enhance chatbot workflows and API interactions.
- Actively involved in debugging, testing, and optimizing chatbot responses for better user experience.

## *Internship*

**TCS-iON, Pune**
*Intern*
*Project: Sentiment Analysis on User Feedback*

- Developed a sentiment analysis system to classify user feedback into positive, negative, and neutral categories using **Natural Language Processing (NLP)** techniques.
- Performed data preprocessing including text cleaning, tokenization, and feature extraction.
- Applied **Machine Learning algorithms** to analyze textual feedback and evaluate model performance.
- Visualized sentiment insights to support data-driven decision-making.

## *Academic Projects*

### 1) Car Recommendation System

The Car Recommendation System is a web-based application designed to recommend cars to users based on their specific preferences and requirements. The system aims to assist users in finding cars that match their budget, preferred features (e.g., car type, fuel type, transmission type), and other factors such as brand and mileage.

**Key Features:**

- **User Preferences Input:** Users can input their preferences like budget, car type, fuel type, and transmission.
- **Recommendation Algorithm:** Based on the user's preferences, the system recommends cars using algorithms like content-based or collaborative filtering.
- **Car Information Display:** Users can view detailed information about each recommended car, including price, specifications, and images.

- **Sorting and Filtering:** The system allows users to filter and sort car recommendations based on factors like price and rating.
- **User Feedback:** Users can rate their recommendations, which will help refine future suggestions.

**Technologies Used:**

- **Frontend:** Angular.js for building dynamic user interfaces.
- **Backend:** Python for handling user requests and fetching data.
- **Database:** SQL for storing car details and user preferences.
- **Recommendation Logic:** Implementing algorithms for matching user preferences with car features.

## 2) Malpractice Detection During Examination Using CCTV

The **Malpractice Detection System During Examinations Using CCTV** is an innovative project aimed at identifying and preventing malpractice (cheating) during exams using CCTV cameras and computer vision techniques. This system uses real-time video analysis to detect suspicious behavior, such as unauthorized movement, communication, or the use of prohibited materials, ensuring the integrity of the examination process.

**Key Features:**

- **Real-Time Monitoring**: CCTV cameras continuously monitor exam halls to capture student behavior.
- **Malpractice Detection**: Using computer vision and machine learning algorithms, the system analyzes video feeds to identify suspicious actions, such as looking at unauthorized materials, communicating with others, or using electronic devices.
- **Alert System**: If any malpractice is detected, the system triggers an alert to invigilators or exam authorities for immediate intervention.
- **Data Logging**: The system logs detected incidents with timestamps and video footage for review and investigation.
- **Integration with Exam Management Systems**: The system can be integrated with existing exam platforms to maintain a seamless monitoring experience.

**Technologies Used:**

- **Computer Vision**: OpenCV or similar libraries for real-time image processing and object detection.
- **Machine Learning**: Training models to detect specific behaviors associated with cheating, such as movement patterns or unusual objects.
- **CCTV Cameras**: Used to capture real-time video feeds during exams.
- **Backend**: Python with Flask/Django for handling video feeds and processing them.

## ***Personal Details***

- Date of Birth: - 29th January 2003
- Languages Known: - Marathi, Hindi, and English.

- Permanent Address: - At post-Wadakshiwale Tal-Ajara Dist- Kolhapur, Maharashtra. 416220.
